

Gumley Road Bridge, Leicester, UK.

The Structure

Gumley Road Bridge is listed red brick structure with a single span of 6.7 meters and a width of 4.9 meters between its parapet walls. It was built to carry road traffic over the Grand Union canal without impediment to boat traffic below. It had a weight restriction of 17 ton.

The Problem

Working in conjunction with British Waterways, Leicestershire City Council required the bridge to be strengthened to carry the 40/44 ton Assessment Live Loading. With both the bridge and waterway in continual use, it was imperative to keep disruption to a minimum.

The Solution

In total, twenty six stainless steel 25 mm diameter CINTEC anchors were installed from the road surface. All were between 2.9 and 3.1 meters in length. For the duration of the project regular vehicular traffic was diverted over another bridge, however it remained open to emergency vehicles, cycles and horses. Boat traffic below remained completely unaffected. Possession of the bridge was originally given over to Archtec for three weeks, significantly, Cintec's drilling and installation contractors APB of Stoke, actually completes the work in only 10 days and so brought back into full service far ahead of the time the council had allocated

Checking for sub-surface services during bridge survey.

Temporary below arch protection during the installation process.
